Special Symbols

Throughout this catalog, the symbol "*" in a catalog number, for example ATSU01N2•LT, designates a character in the number that varies with the product rating.
Overview

While Altistart™ 01 (ATS01) soft starts can be used with almost any motor starter, they now add soft start and soft stop motor control to the TeSys™ U-Line family of motor starters.

When an ATS01N2•LU/QN/RT or an ATSU01N2•LT model is combined with the TeSys U-Line motor starter by means of a power connector, the result is a unique, innovative motor starting solution. A low power soft start installation now has access to all of the benefits of the TeSys U-Line motor starter, including:

- modular design with a standard 45 mm width
- short-circuit and multi-class overload protection
- phase loss, phase imbalance, ground fault, jam, underload, and long-start protection
- fault history
- PC and PDA based programming software
- optional LCD display
- networking capabilities: Modbus™, AS-I, DeviceNet™, Ethernet TCP/IP, Profinet® DP
  - monitoring of motor status
  - remote starting and fault reset
- electronic reversing

The ATSU01N2•LT soft start is optimized for installations offering 24 Vdc control power.

The ATS01N2•LU/QN/RT soft start is self-powered from the AC line supply and is compatible with all other control power schemes.

The panel space required to install the ATS01 soft start and the TeSys U-Line motor starter is minimal, with a standard 45 mm product width and side-by-side mounting. Please consult the TeSys U-Line motor starter catalog (8502CT0201) for TeSys U-Line mounting information. The catalog is available at www.schneider-electric.com.

The ATS01 soft start enhances the starting performance of asynchronous motors by allowing them to start gradually, smoothly, and in a controlled manner. It is ideal for applications that do not require high starting torque. It limits starting torque and reduces the current inrush experienced with other motor starting methods.

The transitionless starting method of the ATS01 soft start avoids the torque surges associated with other reduced voltage starting methods.

Using the ATS01 soft start avoids the damage and expense associated with full voltage starting, such as:

- wear and tear to motors, shafts, bearings, clutches, belts, and other attached machinery
- damage to product due to sudden starts and stops
- production downtime and material waste
- maintenance labor and replacement equipment cost

The ATS01 soft start is designed for the following simple applications:

- material handling conveyors
- belt-driven machinery
- fans and pumps
- small compressors
- automatic doors and gates
- process machinery (such as grinders, mixers, and agitators)
- filling lines
- people movers
- any other application that can benefit from stepless reduced voltage starting

The ATS01 low power mini soft start is compact and easy to install. It was designed to meet IEC 60947-4-2, the internationally accepted standard defining soft starts, and carries the following agency approvals: UL, CSA, CCC, C-Tick, and CE.
Description
The Altistart 01 low power mini soft starts:
- control two phases of the AC voltage supplying the motor to limit starting torque and current
- have motor power ratings of 1/2 to 20 hp (0.75 to 15 kW), three-phase only have a motor voltage range of 208 to 460 V
They are equipped with:
- a potentiometer to set the starting time (3)
- a potentiometer to set the stopping time (5)
- a potentiometer to set the initial voltage applied to the motor when starting begins (4)
- 1 green LED (1) to indicate that soft start power is on
- 1 yellow LED (2) that illuminates 10 seconds after a start command is given indicating that the soft start’s voltage ramp is complete, the internal shorting contactor is closed, and the motor is up to speed
- a removable I/O terminal block (6) that includes:
  - 2 logic or control inputs for Run and Stop commands
  - 1 logic or control input for the Boost or Kickstart function
  - 1 open collector logic or signal output to indicate that the soft start ramp is complete and the motor is up to speed
  - 1 normally-open relay contact that is closed when the soft start is running the motor and open if the soft start is faulted or if the motor has stopped
Altistart 01 Soft Starts
Low Power Mini Soft Starts—Functions

Altistart 01 soft start functions

- 2-wire control
  The start and stop commands are provided by a single logic or control input. As soon as the state of logic input 2 (LI2) goes high (connected to the LI+ or +24 V terminal), the starting process begins. As soon as the state of LI2 goes low (the connection to LI+ or +24 V is removed), the stopping process begins. No connection to LI1 is required.

- 3-wire control
  The start and stop commands are provided by two different logic or control inputs. While logic input 1 (LI1) is continuously held high (connected to LI+ or +24 V), a momentary high on LI2 will provide a start command. A stop command is issued as soon as LI1 goes low (the connection to LI+ or +24 V is removed). To issue a second start command, reconnect LI1 to LI+ or +24 V and momentarily pull LI2 high.

- Starting and stopping times
  The ATS01 soft start controls the starting and stopping time of the motor by ramping the applied motor voltage up and down. The starting and stopping voltage ramp times can be adjusted from 1 to 10 seconds by means of two potentiometers on the front of the soft start. Since the actual motor starting and stopping times are dependent on the level of the applied load, the scale on the front of the soft start is calibrated from A to E rather than from 1 to 10 seconds, with A being the shortest time and E being the longest time. The starting voltage ramp begins at the AC voltage level set by the Initial Voltage adjustment. See the diagram below for more detail. See page 7 for more information about Initial Voltage.

  **Note:** The ATS01 soft start is internally bypassed at the end of the time set by the start time adjustment. If the motor is not up to speed by that time (due to a heavy load), the internal contactor can be damaged, requiring replacement of the soft start.

  **SET THE START TIME AT A LEVEL ACHIEVABLE WITH THE MOTOR AT ITS HIGHEST LOAD LEVEL.**

![Wiring diagram for 2-wire control](image1)

![Wiring diagram for 3-wire control](image2)

![Voltage ramp, initial voltage, and boost](image3)
Initial (or starting) voltage
The initial voltage applied to the motor (the level at which the voltage ramp begins) can be adjusted by a potentiometer on the face of the Altistart 01 (ATS01) soft start. The initial voltage level can be adjusted from approximately 30 to 80% of the AC line voltage. Since the resultant motor torque varies in proportion to the square of the applied voltage (see the diagram below), the scale on the front of the ATS01 is calibrated from A to E rather than from 30 to 80%, with A being the lowest level and E being the highest level. A lower setting will reduce motor current and torque during starting. Set this level to the minimum required that will result in motor rotation immediately after a start command. If no level of adjustment here starts immediate motor rotation, use the Boost function. See the diagram on page 6 for more detail.

**Torque characteristics (typical curves)**

This diagram shows the torque/speed characteristic of a squirrel cage motor in relation to the applied voltage. The torque varies in proportion to the squared ratio of the applied voltage to the motor’s rated voltage at a fixed frequency. For example, 1/2 voltage results in approximately 1/4 torque. The gradual increase in the voltage prevents the instantaneous current peak on start up.

Boost (kickstart) function
If the Boost control input is active (connected to LI+ or +24 V) when a start command is given, full line voltage will be applied to the motor for the first 200 mS of soft start operation. Thereafter, the normal voltage ramp will resume. Use this function to start high inertia loads or applications with a high level of starting friction. See the diagram on page 6 for more detail.

Motor up to speed
The ATS01 soft start provides a logic signal to indicate that the starting voltage ramp is complete and the motor is up to speed. This signal is provided by an open collector output illustrated in the diagrams below. An external power supply is required to complete this circuit.

The ATS01 soft start provides a relay contact to indicate either that it has faulted or that it has stopped running the motor. The normally-open contact between terminals R1A and R1C closes when a run command is provided at LI2. The relay contact opens under either one of the following two conditions:
- the contact opens instantly when the soft start experiences a fault condition.
- the contact opens when the motor voltage reaches zero after a stop command.

This information can be used to sequence a contactor if both line isolation and soft stop are needed in the same application.

- Immunity to voltage disturbances: IEC 61000-4-6 level 3
- Damped oscillating waves: IEC 61000-4-12 level 3

CE marking

The soft starts are CE marked on the basis of European directives governing low voltage (72/73/EEC) and EMC (89/336/EEC).

Product certification

UL, CSA, CCC, and C-Tick

Degree of protection

IP20

Degree of pollution

2 (conforming to IEC 60947-4-2)

Vibration resistance

1.5 mm peak to peak from 3 to 13 Hz, 1 gn from 13 to 150 Hz conforming to IEC 60068-2-6

Shock resistance

15 gn for 11 ms conforming to IEC 60068-2-27

Relative humidity

5–95% without condensation or dripping water, conforming to IEC 60068-2-3

Ambient temperature

- Storage: -25 to + 70 °C (-13 to +158 °F) conforming to IEC 60947-4-2
- Operation: -10 to + 40 °C (+14 to +104 °F) without derating, up to 50 °C (122 °F) with current derating of 2% per °C above 40 °C (1.1% per °F above 104 °F)

Maximum operating altitude

1000 m (3300 ft) without derating. Above this, derate the current by 2.2% per additional 100 m (330ft).

Side-by-side mounting

No gap between soft starts is required

Operating position

Maximum permanent angle in relation to a vertical mounting position

Connections (Maximum connection capacity and tightening torque)

A customized power connector is supplied with the ATSU01N2LT soft starts. It eliminates the need for power wiring between the soft start and the TeSys U-Line motor starter and minimizes the height of the assembly when the two units are mounted one above the other. For ATS01N2LU/QN/RT soft starts, the power connector is available as an option (part number VW3G4104).

Low Power Mini Soft Starts—Selection

**Altistart 01 soft start and TeSys U-Line motor starter combinations**

Numerous combination possibilities exist. Consult the TeSys U-Line Motor Starter catalog, number 8502CT0201, for more information.

1. Standard power rating according to UL508.
2. Depending on the configuration of the selected TeSys U-Line motor starter, replace the \( p \) with A for standard, B for advanced, and M for multifunction.

ATS01N2●LU/QN/RT soft start with GV manual starter, or other motor starter

Group motor installation

Non-group motor installation

(1) Optional contactor for line isolation and remote control.
(2) Other motor starters must provide motor overload protection.

Note: Observe national and local electrical codes when selecting the circuit breaker and other motor starters. See the selection table on page 13 for recommendations on the following components:

- ATS01 soft start
- GV manual starter
- KM1 isolation contactor
- Fuses
- Overload relay
ATS01N2LU/QN/RT soft start with GV manual starter, or other motor starter

Manual control without soft stop

Note: To prevent possible internal damage to the soft start, wait for the motor to stop before changing motor direction.
Overview

ATS01N1 torque limiting soft starts extend the Altistart 01 (ATS01) product range down into the fractional horsepower arena (3 to 12 A, 1/2 to 3 hp at 208 V). They can control the starting ramp of either a single-phase or a 3-phase motor.

As with other ATS01 models, the torque limiting soft starts make it possible to gradually and smoothly start a motor in a controlled manner. They are ideal for applications that do not require high starting torque. This transitionless starting method eliminates torque surges common with wye-delta starting methods. Using the ATS01 soft start avoids the damage and expense possible with an across-the-line start.

The ATS01N1 is ideal for the following applications:

- small conveyors for fragile goods, such as bottle conveyors
- constant power machines, such as drills, where the starting torque must be limited

By reducing the starting torque produced by an asynchronous motor, the ATS01N1 soft start extends the motor's starting time. The ATS01N1 soft start ramps up the AC voltage applied to one of the motor terminals. The other motor terminal(s) are supplied full motor starting voltage. Hence, starting current is not reduced.

This range of the ATS01 family is compatible with the following common motor voltages:

- single phase: 115 V and 230 V
- three phase: 208 V, 230 V, and 460 V

The ATS01N1 soft start is compatible with most single-phase motor designs, including split phase induction, capacitor start, and shaded pole.

The Altistart 01 was designed to meet IEC 60947-4-2, the internationally accepted standard defining soft starts, and carries the following agency approvals: UL, CSA, CCC, C-Tick, and CE.

The ATS01N1 series is one of the smallest soft starts on the market. It comes in two frame sizes:

- 22.5 mm wide modules, rated for 3 and 6 A
- 45 mm wide modules, rated for 9 and 12 A

Both can be DIN rail or panel mounted. They can be mounted side-by-side with no gap between soft starts required.

An internal shorting contactor is provided on the 9 A and 12 A ATS01N1 models to eliminate wasted energy and reduce the heat that must be removed from the control panel.

The 9 A and 12 A models offer removable control terminal plugs for ease of wiring and installation.

Description

The ATS01 torque limiting soft start is equipped with:

- a potentiometer to set the starting time (3)
- a potentiometer to set the initial voltage applied to the motor when starting begins (4)
- 1 green LED to indicate that soft start power is on (1)
- 1 yellow LED that illuminates 10 seconds after a start command is given indicating that the soft start's voltage ramp is complete, the internal shorting contactor (9 and 12 A models only) is closed, and the motor is up to speed (2)
- a control terminal with inputs for either 24 Vac/dc or 110–240 Vac control power
- input (5)
- the control terminal is removable on 9 and 12 A models
Altistart 01 soft start functions

Starting and stopping the ATS01N1 soft start:
The motor starts when both line and control power are supplied to the soft start. The soft start will not soft stop the motor. When the run command is removed, the motor will coast to a stop. If only line power is removed to stop the motor, reapplying line power will not restart the motor. Soft start control power must also be cycled off and on to restart the motor. In a single-phase application, the soft start will allow the motor to stop when either line or control power is removed.

Note: In a 3-phase application, connect line power to the soft start ONLY when soft start control power is present and motor operation is needed. Applying line power when no soft start control power is present will single phase the connected 3-phase motor.

Control power
Control power can be either:
- 110 to 220 Vac (+/- 10%): terminals CL1/0 and CL2
- 24 Vac/dc (+/- 10%): terminals CL1/0 (-) and 24 V (+)

Line power
Line power must match the voltage rating of the motor and must not exceed 480 V.
- Single-phase motors
  Power in: ATS01N1 terminals 1/L1 and 5/L3
  Power out: ATS01N1 terminals 2/T1 and 6/T3
- Three-phase motors
  Power in: ATS01N1 terminals 1/L1, 3/L2, and 5/L3
  Power out: ATS01N1 terminals 2/T1, 4/T2, and 6/T3

Starting times
The ATS01N1 soft start controls the starting time of the motor by ramping up the voltage applied to one phase of the motor. The starting voltage ramp time can be adjusted from 1 to 5 seconds by means of the potentiometer on the front of the soft start. Since the actual motor starting time is dependent on the level of the applied load, the scale on the front of the soft start is calibrated from A to E rather than from 1 to 5 seconds, with A being the shortest time and E being the longest time.
The starting voltage ramp begins at the AC line voltage level set by the Initial Voltage adjustment. See the diagram below for more detail.

Note: The ATS01 soft start is internally bypassed at the end of the time set by the start time adjustment. If the motor is not up to speed by that time (due to a heavy load), the internal contactor can be damaged, requiring replacement of the soft start.
SET THE START TIME AT A LEVEL ACHIEVABLE WITH THE MOTOR AT ITS HIGHEST LOAD LEVEL.

Initial voltage
The initial voltage applied to the motor (the level at which the voltage ramp begins) can be adjusted by a potentiometer on the front of the ATS01N1 soft start. The initial voltage level can be adjusted from approximately 30 to 80% of the AC line voltage level. See the diagram above.
Since the resultant motor torque varies in proportion to the square of the applied voltage (see the diagram on page 7), the scale on the front of the soft start is calibrated from A to E rather than from 30 to 80%, with A being the lowest level and E being the highest level.
A lower setting will reduce motor torque during starting.
Set this level to the minimum required that will result in motor rotation immediately after a start command.

#### CE marking

The soft starts are CE marked on the basis of European directives governing low voltage (72/73/EEC) and EMC (89/336/EEC).

#### Product certification

UL, CSA, CCC and C-Tick.

#### Degree of protection

IP20

#### Degree of pollution

2 (conforming to IEC 60947-4-2)

#### Vibration resistance

1.5 mm peak to peak from 3 to 13 Hz, 1 gn from 13 to 150 Hz conforming to IEC 60068-2-6

#### Shock resistance

15 gn for 11 ms conforming to IEC 60068-2-27

#### Relative humidity

5–95% without condensation or dripping water, conforming to IEC 60068-2-3

#### Ambient temperature around the unit
